

People and contexts

from within-person dynamics to dyads, families, and studies, across home, school, work, peers, and daily life

Broader dynamic models

TVEM, latent transition models, dyadic models, continuous-time models

Dynamic synthesis platform

person-specific dynamic phenotypes

uncertainty-aware synthesis

population-level inference

Linked data streams

linking self-report, wearables, physiology, passive data, and electronic health records

Substantive targets

family stress spillover, affective recovery, sleep rhythms, and daily regulation
