

Fit local models at scale

multi-core
CPU

GPU

multi-node
systems

fit many local models in parallel

person-, dyad-, family-,
or study-specific estimation

Synthesize evidence rigorously

weight by
precision

preserve
heterogeneity

**model outputs
from many units**

compare
plausible models

average across
models

combining evidence across
models, units, and data sources

Deliver usable tools

containers

software

workflows

packages, containers,
and reusable templates
open tools, scalable workflows,
and decision-ready summaries

local estimation → careful synthesis → usable collaboration
