

## Fit local models at scale

multi-core  
CPU

GPU

multi-node  
systems

fit many local models in parallel

person-, dyad-, family-,  
or study-specific estimation

## Synthesize evidence rigorously

weight by  
precision

preserve  
heterogeneity

**model outputs  
from many units**

compare  
plausible models

average across  
models

combining evidence across  
models, units, and data sources

## Deliver usable tools

containers

software

workflows

packages, containers,  
and reusable templates  
open tools, scalable workflows,  
and decision-ready summaries

local estimation → careful synthesis → usable collaboration
